Intellithon'26: Problem Statements

Problem Statement #1: Predatory Loan Clause Detector

The Challenge:

In India's rural microfinance ecosystem, borrowers frequently fall into debt traps due to **exploitative and non-transparent loan clauses** embedded within contracts. These agreements are often written in complex legal language or regional scripts, making them difficult to understand for the average borrower.

Existing AI solutions primarily focus on English corporate contracts and fail to address the needs of underserved populations, leaving a critical gap in financial protection and accessibility.

Objective:

Design and develop a **mobile-first AI-powered solution** that:

- Extracts text from contract images using OCR (supporting regional languages)
- Identifies potentially harmful or non-compliant clauses based on RBI guidelines
- Provides **clear, concise, and user-friendly explanations** of risks in simple language (2-line summaries)

Expected Outcome:

- End-to-end **OCR + NLP pipeline**
- Intelligent **risk detection and clause classification model**
- User-friendly mobile/web interface for easy interaction and understanding

Problem Statement #2: Indic-Legal GPT — Contextual Judicial Bottleneck Resolver

The Challenge:

The Indian judicial system faces a significant backlog of cases, with millions pending across various courts. A key contributor to this delay is the extensive time required by legal professionals to research relevant precedent cases and verify the applicability of local laws or regional amendments.

These legal documents are often written in complex legal English or regional languages, making the research process time-consuming, fragmented, and inefficient. Existing tools lack contextual understanding and cross-lingual capabilities, further limiting accessibility and efficiency in legal workflows.

Objective:

Design and develop a context-aware legal intelligence system that:

- Performs semantic precedent search by understanding the intent of a case (e.g., property disputes, inheritance issues) and retrieving relevant Supreme Court and High Court judgments
- Enables cross-lingual law mapping by extracting, translating, and comparing clauses from regional legal documents with national legal frameworks
- Generates concise and structured case summaries, including key legal principles such as *Ratio Decidendi*, in a simplified format

Expected Outcome:

- AI-powered legal retrieval system with semantic search capabilities
- Cross-lingual document analysis and translation module
- Automated case brief generation system (5-line executive summaries)
- User-friendly interface for both legal professionals and general users

Instructions for Participants

1. Each team must select **one problem statement only** for participation.
2. All submissions must be **original**. Plagiarism or copied solutions will lead to immediate disqualification.
3. Teams are required to build a **working prototype (minimum viable product)** based on the selected problem statement.
4. The use of modern technologies such as **AI/ML, Web Development, APIs, or IoT** is encouraged wherever relevant.
5. Teams must prepare a **presentation/demo** explaining:
 - Problem understanding
 - Proposed solution
 - Technical approach
 - Impact and scalability
6. All required submissions must be completed **within the given timeline**. Late submissions will not be considered.
7. Ensure proper **team coordination and communication** throughout the hackathon.
8. Follow all **event guidelines and code of conduct** during the hackathon.
9. Teams are expected to use **relevant datasets (self-sourced, open-source, or simulated)**. Additional data may be incorporated to enhance the solution.

Innovate with purpose, build with passion, and present with confidence!
